

Section 8: Generic Types

2026年6月3日 14:56

Generics

What & Why?

Creating & Using Generic Types

Generic Constraints

```
ics.ts U ●  
let names = ['Max', 'Anna'];  
let names: string[]
```

```
let names: string[] = ['Max', 'Anna'];
```

```
let names: Array<> = ['Max', 'Anna'];
```

to add these weird angle brackets here,

```
let names: Array<string> = ['Max', 'Anna'];
```

of setting up such a array type

And in the end, you can say that this way

of writing this type is just some kind of shortcut

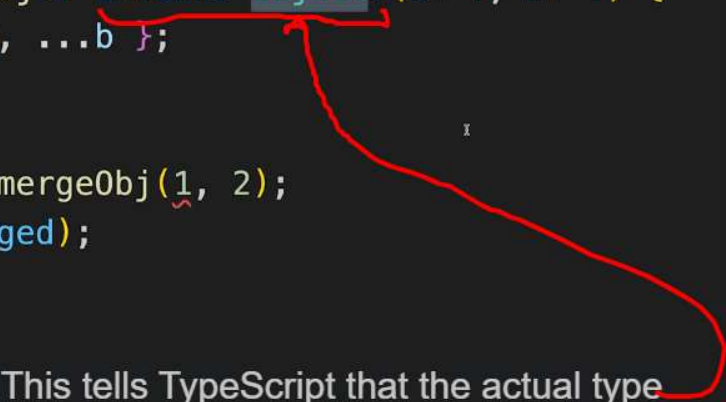

of writing this type is just some kind of shortcut

or convenience feature

provided by TypeScript compared to this form here,

Generic & Constraints

```
19 function mergeObj<T extends object>(a: T, b: T) {  
20   | return { ...a, ...b };  
21 }  
22  
23 const merged = mergeObj(1, 2);  
24 console.log(merged);
```

This tells TypeScript that the actual type

that will be used here must be some object,

Any kind of object but it has to be an object.
